

June 2013

In this phase of the Library Analytics Toolkit project, we are modifying the current application to include metrics regarding electronic resources usage and library location; to provide a more granular breakdown of existing subject divisions; and to improve the user interface including search. Current work involves developing use cases with the data visualization developer so that he can produce wireframes for each. We expect the wireframes to be ready by mid-June and after that the data visualization development work will begin in earnest. Developers in the Library Innovation Lab continue to work on extracting the appropriate data from Aleph and from the COUNTER statistics to feed into the application.
